

## Retinal Eye Health Evaluation

- All patients will be dilated using eye drops during today's exam to assure the health of their eyes. Dilation is the accepted standard of care, and is provided as part of the vision exam.
  - Side effects: blurred near vision, light sensitivity
  - The effects of dilation will last 3 to 4 hours
  
- EyeCare Focus is excited to offer **Optomap Laser Retinal Imaging**. This is the latest technology that offers the widest retinal view (much greater than dilation) to assure the current, and continued health of your retina. **In some cases this may eliminate the need for dilation**, however those patients with currently diagnosed eye health issues or those with reduced vision may benefit from both Optomap and dilation. Children 12 and under still may require dilation in some cases in order to provide a more accurate glasses prescription. The new technology has an additional fee of **\$28** which is not covered by most insurance companies.
  - Side effects: Not recommended for patients with seizures or epilepsy

I choose to have the Optomap retinal imaging (\$28 fee) for myself or my child.
